NASHVILLE FIRE STATIONS

The Metropolitan Government of Nashville and Davidson County is undertaking an aggressive plan to replace

existing Snap-Clad aluminum panels on six fire stations. The stations were design/build projects under the direction of Messer Construction Company, Nashville, as construction manager.

The installation of PAC-CLAD roofs on all six stations was done by Donelson Roofing Company, Mt. Juliet, TN. Two of the stations—#30 in Joelton and #31 in Madison—are 15,000 sq. ft. facilities and were designed by Thomas, Miller & Partners, Nashville. The firm also designed one of the other six new stations.

The Joelton station and the Madison station each utilized approximately 20,000 sq. ft. of 16" Snap-Clad aluminum panels finished in Champagne Metallic.

The stations are located in residential areas and the goal was to make them fit in with the residential fabric of the area. "That was the biggest influence in their design," according to Jeff Earwood, project manager at Thomas, Miller & Partners. "The hips and gables and dormers really respond to the residential areas."

The Metropolitan Government of Nashville and Davidson County, owner of the stations, specified metal as the roofing material due to its longevity and low maintenance. The Madison station has earned LEED Gold certification and the Joelton station is pursuing LEED Silver.

"The goal was to make the stations 50-year-plus buildings," Earwood said. "The use of quality materials and systems plus reputable manufacturers and installers was critical. We had used Petersen on a previous fire station job and had good results. They have a great reputation and live up to it."

The installer of the Petersen roofs, Donelson Roofing, has considerable experience with PAC-CLAD systems. “These were pretty straight-forward applications,” said Michael Smith, estimator and co-project manager at Donelson. “The smallest of the six stations used about 14,000 sq. ft. of PAC-CLAD material and the largest about 20,000 sq. ft. We did have some fairly long panels on the Joelton station—up to 60 ft. But our crews are accustomed to that.”

Petersen manufactures PAC-CLAD metal cladding products in multiple gauges of steel and aluminum. PAC-CLAD products include standing-seam roof panels, hidden- and exposed-fastener wall panels, flush panels, soffit panels, perforated metal, fascia and coping systems, composite panels, column covers, coil and flat sheet. All are available in full 70% PVDF finish (Kynar) in 45 standard colors that include a 30-year finish warranty. Most colors meet LEED, Energy Star and Cool Roof Rating Council certification requirements. Founded in 1965, Petersen’s facilities are located in Illinois, Georgia, Texas, Maryland, Minnesota and Arizona.

For information on the complete line of Petersen metal products call 800-PAC-CLAD, visit pac-clad.com or write to info@pac-clad.com.
