Project No. T149-19

**ASTM E1592-05**  
**STANDARD TEST METHOD FOR**  
**STRUCTURAL PERFORMANCE OF SHEET METAL ROOF AND SIDING SYSTEMS**  
**BY UNIFORM STATIC AIR PRESSURE DIFFERENCE**

**Purpose**

This test method covers the evaluation of the structural performance of Sheet Metal Panels and Anchor to Panel Attachments for roof or siding systems under uniform static air pressure difference.

**Test Date**

3/11/19 Test #1 - 5 Spans @ 5'-0" o.c. with intermittent clips  
3/18/19 Test #2 - 5 Spans @ 5'-0" o.c. with continuous clips  
3/15/19 Test #3 - 12 Spans @ 2'-0" o.c. with intermittent clips  
3/19/19 Test #4 - 12 Spans @ 2'-0" o.c. with continuous clips

**Test Specimen**

Manufacturer: Petersen Aluminum  
10551 PAC Rd.  
Tyler, TX. 75707

Panel: T-PANEL - Metal Roof Panel, 16" wide x 0.032" aluminum with 0.032" alum. cap

Intermittent Clip: 6" wide x 16 ga. galvanized steel clip

Continuous Clip: 120" wide x 16 ga. galvanized steel clip

**Testing Apparatus**

A test chamber was used with two static pressure taps located at diagonally opposite corners. A controlled blower provided a uniformly load the specimen mock-up. Calibrated manometers were used to measure the pressure at each pressure tap. The uniform load pressure was performed in the negative direction to monitor wind uplift on the panel specimen mock-up. Calibrated deflectometers were attached to monitor panel deformation as shown.

### Installation

- The panels were installed on to 16 ga supports with using (2) #14-13 X 1-1/2" long, DP1, Concealor, self-drill fasteners per intermittent/continuous clip at supports. Test #1 & Test #3 used intermittent clips and Test #2 & #4 used continuous clips. Additional screw was used at each end of a continuous clip. The panel sidejoints used a 0.032" aluminum seam cap and were seamed with a mechanical seamer. The seam cap used 2 beads of factory sealant, one bead on each side of cap corners. The panel ends were fastened with (5) 1/4-14 x 1-1/2 long, self-drill, hex head fasteners with washer. The outer side panels were fastened with (2) 1/4-14 x 1-1/2" long self- drill, hex head fasteners with washer at each support along each side of the mock-up.
- Plastic (4 mil thick) was employed loosely between the panels and subgirts and in the side joints to create a vacuum seal.

### Procedure

- The specimen was checked for proper adjustment and all vents closed in the pressure measuring lines.
- The required deflection measuring apparatus were installed at their specified locations.
- A nominal initial pressure was applied equal to at least four times but not more than ten times the dead weight of the specimen. This nominal pressure was used as the reference zero and initial deflection readings were recorded.
- At each load increment, pressure was maintained for a period of not less than 60 seconds and until the deflection gages indicated no further increase in deflections.
- Successive increments were achieved as above until failure or ultimate load was reached.

The test was conducted according to the procedure in ASTM E-1592-05 and as noted herein. In our opinion the tape and plastic had no influence on the results of the test.

Project No. T149-19

## TEST #1

Specimen: T-PANEL - Metal Roof Panel, 16" wide x 0.032" aluminum with intermittent Clip

Clip Spacing: 5 ft o/c

### NEGATIVE (UPLIFT) PRESSURE
